

Data visualization in R

ggplot2 package

- Most confusing key concept: **aesthetic mapping**
- Maps data values to visual elements of the plot
- A few examples of aesthetics:

Let's go over a simple example

- Mean height and weight of boys/girls ages 10–20

age (yrs)	height (cm)	weight (kg)	sex
10	138	32	M
15	170	56	M
20	177	71	M
10	138	33	F
15	162	52	F
20	163	53	F

Map age to x-axis, height to y-axis, and visualize using points

```
ggplot(data, aes(x=age, y=height)) + geom_point()
```

Color the points by sex

```
ggplot(data, aes(x=age, y=height,  
  color=sex)) + geom_point()
```

Change **point size** based on weight

```
ggplot(data, aes(x=age, y=height,  
                 color=sex, size=weight)) + geom_point()
```

And connect the points with **lines**

```
ggplot(data, aes(x=age, y=height,  
                 color=sex, size=weight)) + geom_point() +  
                 geom_line()
```

Oops!

The weight-to-size mapping should only be applied to points

```
ggplot(data, aes(x=age, y=height,  
                 color=sex)) +  
  geom_point(aes(size=weight)) +  
  geom_line()
```

We can also make side-by-side plots (called **facets**)

```
ggplot(data, aes(x=age, y=height,  
                 color=sex)) +  
  geom_point(aes(size=weight)) +  
  geom_line() + facet_wrap(~sex)
```

Facet by age, color by weight, and use bars to plot height

```
ggplot(data, aes(x=sex, y=height, fill=weight)) +  
  geom_col() + facet_wrap(~age)
```

Also plot the sex at the top of the bars

```
ggplot(data, aes(x=sex, y=height, fill=weight)) +  
  geom_col() +  
  geom_text(aes(label=sex), vjust=1.3, color="white") +  
  facet_wrap(~age)
```

ggplot2 package
